

# Protectamats

The **ProtectaMat** is a loose laid mat designed to control foot and wheel borne contamination.

It effectively attracts, collects and retains foot and wheel borne contamination, preventing particles and microbes from getting into and out of your critical areas.

The **ProtectaMat** is available as a loose laid mat or with a self adhesive backing option for heavier wheels and carts.

## Where to use

- All entrances to prevent the ingress of contamination.
- All exits to stop the spread of contamination and cross contamination.
- Inside the critical area adjacent to critical products and processes to prevent contaminants from reaching critical airborne height.

**Active Working System** - The **ProtectaMat** is designed to be an active working zone which attracts, collects and retains foot, wheel and airborne contamination.

**Easy to Clean** - Quick and easy to maintain. Simply clean the surface of the mat with a damp sponge and household detergent. Squeegee dry and wipe up the detergent and contaminant residue. The mat is then immediately ready for re-use.

**Anti-Microbial** - contains an integral silver based antimicrobial additive. Our products have been successfully tested against 50 common organisms including Salmonella, E.coli, Listeria, Campilobacter, Pseudomonas, A.Niger (black spot mould growth), and Algae. The Biomaster additive also helps combat MRSA.

Contact Cleaning is a technology that has been successful in many markets for over twenty years – production of printed circuits, cosmetics labels, medical packaging and large format graphics have all benefited from this yield improvement process.
